

Nokia Intellisync Wireless Email

Nokia brings mobile email to everyone

Nokia for Business

Nokia is changing the economies of mobile email with the introduction of Nokia Intellisync Wireless Email 8.0, giving companies a cost-effective solution for extending wireless email beyond the executives.

Nokia Intellisync Wireless Email is designed to lower the barriers to mobile email adoption by reducing the costs associated with wireless email. The solution leverages the broad availability of standard mobile phones and provides a two-tier licensing model. The base client will be licensed on an unlimited basis with each Nokia Intellisync enterprise server and offers the ability to compose, read and delete email and manage local folders, in addition to robust security. The professional client offers all the features of the basic version plus calendar and contacts synchronization and full attachment handling.

Nokia Intellisync Wireless Email provides full support for the highly diverse range and versions of email systems and mobile devices in use today. By deploying Nokia Intellisync Wireless Email, you are not forced into email system upgrades, and your mobility strategy is not tied to a particular mobile operating system. Different roles in an organization often require different devices. Users should be able to choose the device that best supports their productivity needs, whether a Nokia, Motorola, Palm, Windows Mobile, or other popular platform. Nokia Intellisync Wireless Email takes advantage of native applications on these devices, giving users a familiar interface with the highest degree of functionality.

Nokia Intellisync Device Management lets you manage your mobile security policy from a single interface—with features such as password enforcement and device wipe—across this broad range of devices.

Functionality

Nokia Intellisync Wireless Email is a full-featured wireless email platform that lets users easily and rapidly access their email, calendar, contacts, notes and task lists on almost any mobile phone they chose. Download attachments, respond to meeting requests and manage subfolders while on the

road. Everything—including read/unread/sent emails, drafts, deletions and attachments—is fully synchronized with the email server, whether Exchange, Domino, IMAP, POP3 or XML.

Nokia Intellisync Wireless Email has next-generation mobility intelligence built-in. The automatic parsing of travel information into an easy-to-read itinerary page saves travelers the time required to search through numerous emails for details about flights, hotel reservations, ground transportation, and other critical travel information. It also generates links to maps, directions and weather reports to keep all the information a traveler needs at-hand while on the road.

Serious Security

Military-grade encryption protects your data during communication. Strong password protection and encryption help keep vital information confidential during transfer. For extra security, a self-service web page enables users or IT to lock out or entirely wipe the device clean for theft-loss protection.

Low TCO, Rapid ROI

Streamlined, over-the-air software distribution greatly simplifies initial application loading and updates. Compatibility of the client with a wide range of mobile devices eliminates the need to invest in new devices for every user, helping to keep CapEx costs down especially as wireless email deployment expands to the general workforce. An easy-to-use administrative console means less staff time spent deploying, maintaining and supporting mobile users.

The Mobile Suite Advantage

Nokia Intellisync Wireless Email is one component of Nokia Intellisync Mobile Suite, which connects virtually any corporate data source to virtually any mobile device over any network, providing the most choice and flexibility to meet your current and evolving mobility needs.

NOKIA
Connecting People

Nokia Intellisync File Sync enables you to keep documents up-to-date across the entire mobile workforce without the requirement of searching through various data repositories.

Nokia Intellisync Application Sync enables you to extend any important enterprise application, data store or business process—such as a CRM application—to the field.

Nokia Intellisync Call Connect connects to your compatible corporate PBX to bring the power of the desk phone to the mobile.

Nokia Intellisync Device Management provides one of the most comprehensive device management solutions for cost-effectively managing every aspect of your mobile deployment, backed by Nokia Services with proven expertise and global reach.
